The normal development of voice in childhood
Mette Pedersen

Institution: The medical centre ENT & voice unit
State: DENMARK
Area: LARYNGOLOGY AND BRONCHO-OESOPHOLOGY
Presentation Form: INSTRUCTIONAL COURSE
Date: 06-04-2009
Time: 16:30:00
Room: ROOM 02

The normal development of the child voice is elucidated. Voice analysis with fundamental frequency measured with electroglottography is compared with phonetograms. The change of the voice parameters during development of girls and boys is compared with their hormonal development and the pediatrics parameters. ref. Mette Pedersen, MD. The normal development of voice in childhood. Publisher: Springer.com
